### **The Authority in Age & ID Verification**

BUENA PARK, CA, March, 2001 – Since minors today can easily alter or acquire state-of-the-art fake ID's, they are becoming impossible to spot with the untrained eye. ViAge offers the most affordable and effective solution to this problem. Retailers and law enforcement will be able to detect fraudulent, altered and expired ID's and thus protect our youth from acquiring age sensitive products and services.

In the Spring of 2001, CardCom Technology unveiled the newest members of their ViAge Verifier family, the ViAge Verifier CAV-3000 Series . Designed to read magnetic stripe, 1D and 2D bar codes found on state, provincial, and military ID cards, the CAV-3000 Series offers users an all-in-one solution for age verification, while maintaining the ViAge Verifier qualities of affordability, portability, flexibility and simplicity.

Several law enforcement agencies have already endorsed the ViAge Verifier because of its ease-of-use, dependability, and accuracy. In addition the ViAge Verifier uses lower cost magnetic stripe technology allowing it to be priced more affordably.

In September of 2000, CardCom Technology pushed their goals in a positive direction by being a corporate sponsor of the National Youth Summit presented by Mothers Against Drunk Driving (MADD). 435 teen delegates from each congressional district in the country came to Washington DC for six days to discuss and find possible solutions the nation's number one youth drug problem – underage drinking. Aside from the corporate sponsorship, CardCom went a step further by presenting the delegates magnetic stripe technology and magnetic stripe readers used to verify the validity of identification as a possible solution to deter underage drinking. As one of only four recommendations to Congress, the use of magnetic stripe technology was on top of the list. CardCom Technology will continue to support organizations that help shape the youths of today to become the leaders of tomorrow.

### **About Cardcom Technology**

Founded in 1993, CardCom Technology has been providing solutions from magnetic stripe and smart card applications since its inception. The founder, Mitchell Shin, applied his knowledge of magnetic stripe technology, and invented a low cost, ID verifying device called the ViAge Verifier . Designed to calculate the age and date of birth of an individual directly from government issued identification cards (drivers licenses, ID cards, etc.), the ViAge Verifier reads the magnetic stripes of twenty-four US State and Canadian Province ID's.
